

NORTH COAST RESIDENTS:

Help Maintain Stream Flow this Summer for Threatened and Endangered Fish

Coastal streams in Northern California are experiencing extreme low flows this summer. For example, in Ukiah, the 2020 water year is on track to be the third driest year in the 127 years of record. Flows in most streams in Northern California are at or below those of the 2012-2016 drought. The low flows are a significant threat to the survival of this year's juvenile coho salmon and steelhead. During the summer months, coho salmon and steelhead depend on small amounts of flow to provide food and maintain survivable temperature and oxygen levels in pools. Due to the extremely low flows this summer the survival of juvenile coho salmon and steelhead are at a precarious junction until winter rains return and they can migrate out to the ocean.

Every week is critical for threatened and endangered coho salmon and steelhead populations, so immediate actions to help conserve water by all surface water and groundwater well users is needed to mitigate the dry conditions this year. Surface flows in waterways are influenced by groundwater, especially during summer months. You can help protect these fish by reducing your surface and

groundwater well diversions, and conserving water. Even small efforts by individual property owners can result in significant cumulative stream flow benefits that will help maintain (and ideally increase) existing instream flows and help support these fish. Such efforts include:

- *Reducing water diversion activities (including groundwater) to preserve stream flow.*
- *Conserving water, reusing greywater, and limiting irrigation of landscaping and lawns to reduce water use.*
- *Coordinating with your neighbors to divert water at different times to limit cumulative impacts.*
- *Prepare for next year by exploring roofwater harvesting, tank storage, and other long-term options.*

Any immediate actions taken on your part could be instrumental in protecting your local creek this summer! Additional information on ways to conserve water can be found at: saveourwater.com.
